

Development preview | 4 November 2026

Small dongle: 20 × 40 mm PCB for one keyboard or mouse. SMT electronics. The pictured male PS/2 plug and mounting are concepts; final overall dimensions remain unverified.

Through-hole dual: 72 × 70 mm PCB for keyboard and mouse together, with two USB-A inputs and two short PS/2 leads. All fitted PCB parts are through-hole.

Wireless approach: compatible USB wireless receivers, with the Commander X16 as the target computer. There is no onboard Bluetooth radio. Both designs target X16 port power, subject to source-current and startup testing.

Before release: firmware, receiver compatibility, electrical behavior and physical connector/enclosure fit still require testing. Mouser component sourcing is the target; final kit contents and any direct fulfillment arrangement are not confirmed.

Announcement only. No sales or preorders. Pricing and release timing will be announced after testing is complete. These renders are not photographs of working hardware.
